THE CONSUMER AND THE STANDARDIZATION OF FARM PRODUCTS*

By Caroline B. Sherman, Associate Agricultural Economist,
Division of Economic Information

Housekeepers in increasing numbers are asking how they can use the Federal standards for food products when they are doing the marketing for their families, and managers of cafeterias and diningrooms, who buy in larger quantities, seem to be even more interested in using these standards.

Federal standards for farm products as a rule have first been worked out from the producers' end of the marketing process. The consumer has been kept ever in mind but only within recent years has it seemed practicable to bring the work to the consumer in tangible and concrete form. Even now, the lines of work in which this has been accomplished are few in number but they make at least a promising list.

Much as we may wish, theoretically, that all standardization work would carry through to the consumer, the fact that many of the lines do not yet reach that far limits the consumer's study of standards for practical use to a reasonable task. The standardization work on farm food products alone is progressing at such a rate and in so many directions that even one whose work is in close touch with all lines of it feels almost bewildered with the multiplicity of its phases and the possibilities in its use. For any housekeeper with her variety of duties and interests to use standards that were not designed with her problems in mind is a difficult undertaking, but these standards are less puzzling to the woman whose chief business is buying for a cafeteria or an institution, and who is acquainted with wholesale markets.

Hesitant judgment on the customer's part is replaced by certainty when marks, or labels, or certificates, can be used, for the device stays on or with the product till it reaches the customer and tells her the grade without any effort on her part. To be sure, workers who have examined closely into the matter state that many customers do not read the labels, but apparently the number of those who heed the labels is increasing among those who believe in getting their money's worth. The labels or devices do not need to supersede judgment - rather they can act as teachers, for by studying the characteristics they represent, the consumer should be the better prepared to use her own judgment on similar unlabeled products.

*Compiled from articles, addresses, and releases issued by the Bureau.

In answering the queries from consumers, the Bureau of Agricultural Economics now divides the list of standards of direct interest to consumers into two fairly well-defined groups. The first group includes those that can be readily used by the individual housekeeper under certain conditions, because of the device, or stamp, or certificate, or other visual indication of grade. The second group includes those that are so marked on some wholesale markets and so can be used by the cafeteria manager or other consumer who buys in quantity on those markets.

In the first group are beef, lamb, turkey during the holiday season, eggs, butter, and certain canned fruits and vegetables. Canned chicken and other canned chicken products might be roughly included, since those put up by a large number of firms now bear a label denoting wholesomeness if not quality grade.

Meats

Much effort has been directed, by some of the meat specialists of the Bureau, to teaching housekeepers and other customers how to choose meats of good quality. Lectures, demonstrations, exhibits, pamphlets, and posters were used in this campaign. The interest of the housekeepers and their apparent need, along with other factors, stimulated these men to develop a method by which even those housekeepers who are not apt pupils can now choose their cuts of beef with confidence. They devised a roller grading stamp, to be used with ink that is harmless and that usually disappears in cooking. This stamp is moved with an undulating movement over those parts of a carcass that later become retail cuts. The stamp repeats the class and grade names in such a way that they appear on each retail cut and give the customer the information she needs regarding its quality. It is different from the purple stamp used in the Federal meat inspection work to show that the carcass has been inspected for diseased condition. This grading work takes place later and is an optional service. It is especially designed to aid in the merchandising of meats under exactly the true grade names so that when a housekeeper says she wants a Good grade roast or steak she can be sure of getting one of good quality. In fact, this service has been developed with the millions of American housewives particularly in mind. 1/

This meat-stamping service is available for U. S. Prime, U. S. Choice, U. S. Good, and U. S. Medium grade beef carcasses and wholesale cuts in the cities of Baltimore, Boston, Buffalo, Chicago, Detroit, Erie, Kansas City, New York, Omaha, Philadelphia, Sioux City, St. Louis, Washington, D. C. and Wichita. Anyone who calls for the service - slaughterer, packer, wholesaler, jobber, hotel or restaurant buyer, or retailer - can have it for a nominal charge, which amounts to less than 5¢ for each carcass. This graded and stamped beef is available in any part of the United States in which the retailers order from slaughterers or dealers who make use of this service - and this is a very wide area. Official graders in these cities will grade and stamp meats on the request of either sellers or buyers.

1/ For further information send for Leaflet 67: Beef Grading and Stamping Service, by W. C. Davis, issued by the United States Department of Agriculture.

During 1932, more than 119 million pounds of beef were stamped for sale on the markets; this is exclusive of beef stamped for veterans' hospitals and other Government institutions and shows an increase of approximately 50 million pounds over the quantity for sale during 1931.

The service is extensively used by hotels, restaurants, hospitals, steamship lines, Pullman dining cars, and other institutions. It has been an important factor in building up business in many restaurants and hotel diningrooms. In Omaha, for instance, practically every public diningroom has been using and advertising the stamped meat for several years.

The service is already popular with individual housekeepers, for they feel that the Government stamp is an accurate measure of quality and a safeguard against the sale of inferior beef at high prices. Some housekeepers are buying meat more freely as well as more confidently, now that it is stamped by grade; they say they feel sure of satisfying the family and of getting their money's worth at the same time. This increased buying exactly suits the meat dealers, so they are becoming more and more interested in the stamping. Many who are selling the stamped beef report a steadily increasing demand for beef of the higher grades. Evidently many housekeepers are willing to pay the prices of good meat if they are sure that when it is served on the table it will prove to be as good as it is recommended to be.

Naturally dealers are not likely to change their places of buying unless they feel rather sure that the change will improve their business. If a dealer believes that his customers will not take an interest in the grade stamp or know what it means, there is not much inducement to him to make a special effort to stock up with the stamped beef. But if his customers ask for it, and continue to ask for it, a dealer is likely to go after the kind of supplies that his customers want. So it is evident that just how available these stamped meats are to be in the local groceries, independent retail markets, and chain stores, depends, to a large extent, upon the housekeepers themselves. Real demand is almost certain to bring a supply. As yet only the four higher grades of steer and heifer beef are stamped, but the Bureau will stamp other classes and all grades whenever there is sufficient demand.

The lamb grading and stamping service was inaugurated late in 1930 and is now available at all cities in which the beef-grading service is conducted. Three grades of lamb are stamped - U. S. Prime, U. S. Choice, and U. S. Good. During the year 1931, more than 1 million pounds of lamb were graded and stamped; during the year 1932, nearly 6 million pounds of lamb were graded and stamped. Thus the lamb-grading service is growing more rapidly than did the beef-grading service during its first two years of existence.

Turkeys

Turkeys have been graded for the Thanksgiving and Christmas markets during the last six years. In the early years of this work the turkeys were marked by grade for the consumer, either by stamping each individual

bird or by labeling it. The grading service and method of grading have been rendered both at shipping points and at terminal markets. During the first few years the work was done principally at terminal markets but in the last few years the work has been done largely at shipping points. At present, only a few of the turkeys are being marked individually with their grade name attached. Most of the turkeys are merely packed in boxes and the box itself is stamped with the grade of turkeys it contains. Approximately 5,000,000 to 7,000,000 pounds of turkeys are being graded annually.

This Bureau has experimented considerably to find the best way to mark the individual turkeys with the grade. At first the grade was stamped on the back of the turkey that met the requirement for U. S. Prime Grade and a tag was also attached to one wing, giving the grade and other information. At present, two grades of turkeys are marked where any marking of the individual bird is done. These grades are U. S. Prime and U. S. Choice. The grade name is printed on a cardboard tag and is attached to the individual bird by means of a metal fastener which passes through the skin of the breast or wing. This metal fastener is so devised that when once attached it cannot be removed and used again on another bird.

Eggs

Considerable work has been conducted by the Bureau in carrying the U. S. grades of eggs through to the consumer. This is done by means of certificates of quality which show the U. S. grade and size of the egg and which are used to seal the 1-dozen cartons in which the eggs are packed. At present, some 19 dealers have been authorized to use the certificates of quality on eggs and approximately 2,000,000 dozens of eggs are being marketed annually under such certificates. This work is being carried on in widely scattered areas, including Los Angeles, San Francisco, Seattle, Denver, New York, and Washington, D. C. The consumers are apparently favorably inclined to the purchase of eggs plainly marked with the U. S. grades. The Bureau's experience in the use of certificates of quality on eggs indicates that the method has definite advantages in promoting the sale of good quality eggs, as well as in protecting the consumer in regard to the eggs bought.

Butter

A similar service is available for butter. Cartons of certain widely distributed brands of high quality butter contain certificates of quality which show the score of the butter and the fact that the butter has been graded by an authorized representative of the U. S. Department of Agriculture. At present, some 23 firms are authorized to use such certificates of quality. Sales of butter with certificates of quality approximate 60,000,000 pounds each year. The sale of butter with certificates of quality is more widespread than the similar sale of eggs.

Canned Chicken and Chicken Products

A service that the Bureau now conducts for canners of chicken and chicken products (such as chicken soup, chicken broth, and boneless

chicken) has to do with the condition and wholesomeness of the poultry used rather than quality, but the work is closely related to the standardization and grading work. The label used on canned products prepared under supervision of the Bureau bears an inspection legend printed on it, which shows that the chicken used in the preparation of the product has been inspected and certified by the Bureau. Qualified veterinary inspectors examine all carcasses thoroughly and reject all that are unwholesome. This service was inaugurated at the request of the canners and approximately 20 firms located in Massachusetts, New York, New Jersey, Delaware, Indiana, Illinois, Minnesota, and Washington are now using it. Approximately 1,500,000 pounds of poultry are inspected monthly. These labeled goods are more or less widely distributed, so that housekeepers in any of the larger cities and in many of the smaller towns should be able to obtain these government-inspected products.

Canned Vegetables and Fruits

Recently for the first time a few canners and distributors used the simple grade terminology "Grade A," "Grade B," etc., on their labels to assist consumers in purchasing canned vegetables by grade. This is the terminology used in the grades for these products developed by the Bureau and now used in connection with the inspection and grading of canned products under the Farm Products Grading Law and the U. S. Warehouse Act. Grades have been developed either in tentative or recommended form for the following commodities: Apple sauce, grapefruit, beets, corn (cream style), corn (whole grain), lima beans, peas, pumpkin (squash), sauerkraut, snap beans, spinach, succotash, tomatoes, and tomato pulp.

Reports reaching the Bureau indicate that several hundred thousand cases of canned vegetables thus labeled will be available on the shelves of the grocers of the country in the fall and winter of 1933. The Bureau feels that this type of labeling is particularly desirable as it enables the consumer to make her selections actually on the basis of the quality she prefers. In general, Grade A represents the finest, most succulent vegetables. Grade B vegetables may not be quite so tender and succulent, but may be termed the general utility grade and may be found very satisfactory for use in the average household. Grade C merchandise will be found to be wholesome food and has a definite use in the average household. For example, Grade A canned corn is very generally used as a sidedish; Grade B may be used for making of pudding and casserole dishes; and Grade C canned corn furnishes the basis for excellent soup. The Bureau feels that the housewife will do well to insist on buying merchandise on which the grade is indicated in the simple terms suggested herein.

Fresh Fruits and Vegetables

Coming now to the second group of products, the Bureau has worked out standards for practically all fruits and vegetables and each year a larger quantity is sold under these grades. It is estimated that 80 percent of the commercial potato crop is so sold. Large quantities of apples are sold under grade, and so on, in decreasing proportions, down to the minor products, like shallots and chicory. But as a rule these grades and their designations are not as yet carrying through to the retail mar-

kets; either because the producer does not mark the grade on the container or the dealer who has bought the commodity by the United States grade sometimes discards the part of the container that bears the mark.

Some buyers who purchase wholesale containers of potatoes and apples, are now asking for United States grades, on some of the markets, and are already frequently finding the grade marks when they look or ask for them. The more they ask the more they will find them. An increased and consistent demand may mean that dealers on the wholesale markets will make a point of featuring the U. S. grade mark.

Since these grades were designed for the wholesale rather than the consumer trade the report of a recent informal demonstration may be useful. An inspector examined a bag of U. S. No. 1 potatoes and in a few words showed how and why it had been so designated. He explained that the grade allows for a certain number of small and defective specimens such as would usually grade as U. S. No. 2, for the grading must be done quickly as the tubers pass before the grader on a moving belt, that through oversight and some error of human judgment, a few No. 2 potatoes will inevitably slip by. Looking through the bag the inspector found that the number of undesirable tubers did not exceed the number allowed. He explained that the retailer, who would normally buy this bag, might sort out the potatoes into more closely uniform lots if he had an exacting class of customers. For a wholesale grade some dust on the potato or in the bag is allowable for, he explained, with such a cheap commodity as potatoes the grader can not be expected, at present, to grade very closely or to clean each potato; to take the time and trouble to put up bags of perfectly clean potatoes running absolutely close to the median of the grade would necessarily make U. S. No. 1 potatoes so expensive that the work would not be justified. Under present conditions it is justified only in the case of some of the fancy packs of baking potatoes.

Quality factors such as size and color do not change after time of grading and packing, while condition factors such as ripeness and decay may change materially during the transit or storage period. The more perishable of the fruits and vegetables, like peaches and spinach, change in condition from day to day and almost from hour to hour, especially if they are handled frequently; and the storekeeper would have to handle them frequently if he were to try to keep each unit within a specified grade, for peaches that are U.S. Fancy in the morning may be spotted with decay by late afternoon - quite unlike cheese in which increasing age is notoriously to the good. The present grades for these perishables are based on the factors of (1) variety, (2) quality (such as under-maturity, general appearance, shape, color, and relative freedom from the defects that cause waste or unreasonable deterioration), and (3), usually, size.

Considering these and many other facts, specialists in fruits and vegetables believe that in general the greatest improvement can be brought about by improving the quality of the products shipped to market; therefore they are concentrating their activities on grading and standardization work at producing centers. Such standardization work, based on systematic studies of consumer preferences, is slowly revolutionizing the character of the trade in perishables and is yearly giving the housekeepers better produce for every dollar spent on it, although these returns are in a form that she is not likely to recognize.

Rice

Milled and brown rice can now be bought by Federal grade. More and more, retail packages of rice are seen on the grocery shelves carrying these grade names although all of the labels do not use the "U. S." before the grade name.

Dry Beans

Standards have been worked out for 21 classes of dry edible beans, and these standards are used to a considerable extent in the trade. To a limited extent now, the retailer is getting beans under these grade names and indications are that many more retailers will soon handle them by the grade. Therefore consumers might well begin to ask for beans in that way.

Containers

In one important line, standardization work, once accomplished, is done permanently and the customer can put all further care on that score behind her. In 1913, when standardization work on farm products was just making a good start, the Bureau had constant queries, both from housekeepers and from certain elements in the trade as to whether anything could be done to eliminate the nuisance of "snide" berry and fruit boxes. Frequently when they emptied out a berry box, the housekeepers complained, they found the bottom set high in the box, and similar practices deprived them of their rightful due of other small fruits.

Several years ago, Congress passed a standard-container law which prescribed the sizes for baskets for small fruits and vegetables in interstate trade. By this law more than a dozen sizes of grape baskets were reduced to three and more than 33 sizes of berry boxes and till baskets were replaced by 6 common sizes. A few years later another bill was passed which standardized hampers, round-stave baskets, and market or splint baskets. Nine sizes of hampers, for instance, now replace about 50 styles and sizes that had been in use. Formerly when a housekeeper bought a hamper of vegetables she did not know whether she was getting a full bushel or seven-eighths of a bushel, for the same price was usually paid regardless of the size of the so-called bushel hamper and the difference in size was not evident. Market baskets are used in selling many commodities on some markets, and they varied widely in capacity as well as in style. It was even more difficult to detect their discrepancies by eye than in the case of the hampers. The sizes are now only six in number; the same styles are allowed, but they must conform to these sizes in capacity.

These standard sizes, once set, have met with almost universal favor so the work of enforcing the standard container laws has been largely a work of education, and of servicing manufacturers' operations by seasonal tests of their containers.

Crates and boxes - including cartons for fruits and vegetables - are still unregulated as to sizes although cartons are becoming increasingly important and diversified.

In Conclusion

The specifications or descriptions of the grades of almost any farm product will be sent by the Bureau of Agricultural Economics to any consumer who writes for them and who designates the specific commodities in which she is interested. Some of the specifications that may be unsuitable for her use may still be suggestive of things to look out for in buying. For instance, the careful housekeeper would glean some useful information and some practical hints from the study of the Bureau standards for any meats, especially if she is in a position to compare the printed specifications with the labeled beef.

Huge sums are spent by many large growers' organizations and many large firms in retail store work, in which, through displays, folders, and labels, they are bringing the consumer much information that works to the advantage of all. Government grades are increasingly recognized as one means of carrying on such work. Some leaders in the Federal standardization work believe that eventually many of the U. S. grades will be carried to the consumers chiefly through these large distributors and advertisers. Demand from the consuming end will of course do much to further such a development. Many large cooperative growers' organizations and large firms do not now see how they can profitably relate their brands closely with the official grades but there are signs that such a development may be coming.

The chief of the Bureau has said in effect that the consumer phase of standardization - the development of grades on which individual consumers can buy - is the all-important element in the future standardization program. Many of the consumers need and want these grades; their demands must be met and the other consumers must be reached, for until the individual consumers think in terms of qualities and buy on the bases of grades that signify quality, there can not be the most sensitive adjustment of price to quality.
